Fracture strength, also known as breaking strength, is the stress at which a specimen fails via fracture. This is usually determined for a given specimen by a tensile test, which charts the stress-strain curve (see image).

The National Annex must be consulted for guidance on which method to use. In the UK, the National Annex allows either approach to be used. However, in almost all persistent design situations the use of the second method (the use of expressions 6.10a and 6.10b) will produce lower design values of the effects of actions (and for buildings, 6.10b ...

This aluminum oxide, developed by Norton/St. Gorbain, has 23% Zirconium Oxide in it. The result is a more durable and fracture resistant abrasive for use in high pressure applications.
